During the past three decades, every major advance in computing introduced new and largely unanticipated security challenges. Wireless sensor networks are only the latest technology that confirms this observation. These networks, which represent a basic tenet of what we call ubiquitous computing, are now or will soon be deployed in physical environments that are vulnerable not only to the vicissitudes of nature but also to acts that could be easily viewed as hostile attacks by potent adversaries. Indeed, unattended operation of sensor-network nodes in hostile environments requires that we rethink the definition of our adversary, its capabilities and modes of attack.

There are few problems of wireless sensor network design and analysis that are as challenging as localization and time synchronization. Yet both are fundamental building blocks not just for new applications and but also security services themselves. Localization complexity is, to a significant degree, the result of deployment and operation in environments that lack unobstructed line-of-site connectivity, reference points, and communications. Further, time synchronization gains added complexity due to the limited computing resources sensor nodes possess. As a consequence, the natural interplay between space and time measurements and bounds, which are basic to both localization and time synchronization, produces a largely uncharted research territory. And, of course, the new capabilities and attack modes of the new adversary complicates the landscape in unanticipated ways.

This book represents a snapshot of our understanding in solving problems of robust, resilient and secure localization and time synchronization at the inception of the sensor network technology development. It offers a clear view of the essential challenges posed by localization and time synchronization in sensor networks, subtleties of potential solutions, and extensive discussion of specific protocols and mechanisms required by these solutions. In short, the book is an indispensable reference to both researchers and developers, and an invaluable aid to students.

I am pleased and honored to have been asked to write the foreword for this book. The authors, all active researchers in the area of sensor network security, should be congratulated for providing this valuable reference book for the research community.

Virgil D. Gligor
Preface

This book is an outcome of a special workshop on Localization in Wireless Sensor Networks, held between June 13-14 of 2005, at the University of Washington, Seattle.

During several technical discussions, Dr. Radha Poovendran of University of Washington and ARO Information Assurance (IA) program director Dr. Cliff Wang felt that robust and resilient localization for wireless sensor networks is an important research area and a special workshop was needed to address the research challenges and to promote innovative ideas for solutions. Dr. Sumit Roy from the University of Washington later joined the organizing committee. The workshop was organized and held successfully. Over 30 researchers participated in the workshop and a total of 18 presentations were made, covering various aspects of the localization problem.

This book is a direct outcome of this special workshop. We have also expanded the scope of this book to include secure time synchronization since the techniques used for localization distance bounding protocols are dependent on correct time synchronization of wireless sensor networks. A total of sixteen contributed papers are received from both workshop participants and researchers active in wireless sensor network research. The collection of these high quality papers makes this edited volume a valuable resource for both researchers and engineers in related fields. We believe that this book will serve as a reference as well as the starting point of research in the exciting areas of secure location estimation, secure time synchronization, verification of sensor security protocols, and location privacy.

The book is organized into three parts. The chapters in Part I present approaches for sensor location estimation under a benign environment and technical discussions focus on the quality of location estimation. The chapters in the Part II of the book contain the latest work on resilient sensor location estimation in the presence of an adversary that may inject Byzantine errors into the localization process. Also in Part II of the book, there is one chapter dedicated to distance bounding protocol verification and there is another chapter that focuses specifically on privacy protection against location tracking. The Part III of the book contains chapters addressing the problem of secure time synchronization in wireless sensor networks.
We would like to express our thanks to Professor Sushil Jajodia for including this book in his series. We thank Susan Lagerstrom-Fife and Sharon Palleschi of Springer, and Krishna Sampigethaya of University of Washington for working closely with us during the production of this book. We also thank Krishna Sampigethaya, Loukas Lazos, Mingyan Li, Patrick Tague, and Javier Salido for their help and support during the workshop.

Contents

Part I Localization Techniques

Range-Free Localization
Radu Stoleru, Tian He, John A. Stankovic ........................................... 3

A Beacon-Less Location Discovery Scheme for Wireless Sensor Networks
Lei Fang, Wenliang Du, Peng Ning ......................................................... 33

Learning Sensor Location from Signal Strength and Connectivity
Neal Patwari, Alfred O. Hero III, Jose A. Costa ..................................... 57

Node Localization Using Mobile Robots in Delay-Tolerant Sensor Networks
Pubudu Pathirana, Nirupama Bulusu, Andrey Savkin, Sanjay Jha, Thanh Dang 83

Experiences from the Empirical Evaluation of Two Physical Layers for Node Localization
Dimitrios Lymberopoulos, Andreas Savvides ........................................ 105

Part II Secure Localization

Robust Wireless Localization: Attacks and Defenses
Yanyong Zhang, Wade Trappe, Zang Li, Manali Joglekar, Badri Nath ........... 137

Secure and Resilient Localization in Wireless Sensor Networks
Peng Ning, Donggang Liu, Wenliang Du .............................................. 161

Secure Localization for Wireless Sensor Networks using Range-Independent Methods
Loukas Lazos, Radha Poovendran ......................................................... 185
